

Agentic Malware Analysis: From Assistance to Automated Investigation

Tim Blazytko

@mr_phrazer

synthesis.to

tim@blazytko.to

About Tim

- PhD in binary program analysis & reverse engineering
- **independent** — consulting, training & tooling
- focus: (de)obfuscation, malware analysis & automation

Foundations

Agentic reverse engineering

Agentic malware analysis

Foundations of Agentic RE

From Prompting to Agents

- prompting: paste code, ask questions, copy results back
- no tool access, no iteration, no memory
- agents can read files, run commands, modify code

Agentic Analysis Environment

The diagram illustrates the components of an Agentic Analysis Environment. It features a large dashed green rectangle that serves as a container. Inside this container, at the top, is a light gray rounded rectangle with a dark border containing the text 'Agent Runtime (Claude Code / Codex)'. At the bottom of the dashed container is a smaller white rectangle with a green border containing the text 'sandboxed analysis environment (Docker)'. A dashed green line connects the right side of the 'Agent Runtime' box to the left side of the 'sandboxed analysis environment' box, indicating a relationship or flow between the two.

Beyond Standard Tools

Why Dedicated Tools?

- agents *can* script everything from scratch
- but scripting wastes context and hurts reliability
- dedicated tools: less context, better results

Why Dedicated Tools?

- agents *can* script everything from scratch
- but scripting wastes context and hurts reliability

give agents the right tools, not just a shell

- dedicated tools: less context, better results

MCP

Model Context Protocol

standardized protocol
for tool access

MCP

Model Context Protocol

standardized protocol
for tool access

Skills

reusable agent workflows

recipes, templates,
procedural know-how

MCP Changes the Interface Layer

- standardized protocol for agent-to-tool calls
- agents discover, invoke, and process tool results
- from assistant chat to autonomous tool execution

Ghidra Headless MCP

disassembly

instructions, blocks

decompilation

pseudo-C output

xrefs

callers / callees / data

types

structs, datatypes

symbols

labels, names

annotations

rename, retype, comment

<https://github.com/mrphrazer/ghidra-headless-mcp>

Skills: Reusable Workflows

- task-specific guidance that tells agents **how** to approach a problem
- include workflows, scripts, templates, output expectations
- limit exploration by providing structured guidance
- composable: combine skills for complex multi-stage tasks

Agentic Malware Analysis

Task Automation

The Repetitive Side of Malware Analysis

string & config decryption

API hashing & imports

unpacking & multi-stage

IOC & artifact extraction

Handover to the Analyst

Handover to the Analyst

Example: Bundestrojaner (mfc42ul.dll)

H1: Full-Featured Surveillance RAT –VALIDATED

- Discovered complete `command dispatch vtable` at 0x1003d7d0 with 10 remotely-callable commands
- Mapped orchestrator vtable at 0x1003d7f8 with C2 data loop, fingerprinting

H6: C2 with AES-128 Encryption –VALIDATED

- Protocol vtable at 0x1003d330: `encrypt+send`, `recv+decrypt`, raw I/O via WinSock `send()/recv()`
- `Encrypt: sub_10012130`, `Decrypt: sub_10013260`, `Key expansion: sub_10014410`
- Wire format: C3P0-r2d2-POE →4-byte length →AES-128-ECB encrypted payload

privacy & data protection

digital sovereignty

air-gapped networks

chain of custody

Agentic Analysis Environment with Local LLMs

Agentic Analysis Environment with Local LLMs

Local LLMs — Pros & Cons

Pros

runs offline

privacy-sensitive

fully self-hosted

Cons

slower per query

below frontier capability

needs GPU / workstation

workstation-friendly: Qwen3.6 with quantization

on-prem cluster: GLM-5.2, Kimi K3, DeepSeek-V4

Qwen3.6 27B / 35B-A3B	GLM-5.2 753B	Kimi K3 2.8T	DeepSeek-V4 Flash / Pro
--------------------------	-----------------	-----------------	----------------------------

open weights $\neq$ workstation-sized

workstation-friendly: Qwen3.6 with quantization

on-prem cluster: GLM-5.2, Kimi K3, DeepSeek-V4

Wrap-Up

Current Limitations

non-deterministic reruns

context-window limits

analyst still in the loop

output needs validation

Takeaways

1. agents = LLM + tools + loop + goal, driven via MCP and skills
2. they reliably handle focused RE and malware tasks
3. pipelines turn task automation into deeper, resumable investigation
4. analyst expertise shifts towards steering and validation

agents change the economics of reverse engineering

Training topics

- Reverse Engineering & Binary Program Analysis
- Software Deobfuscation Techniques
- Android & Firmware Reverse Engineering
- Agentic Reverse Engineering & Malware Analysis

on-site & remote — tailored to your team
